Initial Seismic Assessment

for Hutt City Council

Project 9792

April 2020

9792 9 April 2020 Private Bag 31912 Lower Hutt 5040

Attention: Aaron Marsh

Dear Aaron,

Initial Seismic Assessment Report Richard Prouse Park Changing Rooms and Toilets, 87A Hine Road, Wainuiomata

We have now completed an Initial Seismic Assessment (ISA) of the changing rooms and toilets building at Richard Prouse Park, 87A Hine Road, Wainuiomata using the Initial Evaluation Procedure (IEP) as described in Part B of the guideline document, *The Seismic Assessment of Existing Buildings-Technical Guidelines for Engineering Assessments*, dated August 2017. The assessment was carried out after completing a site visit on Wednesday 25 March 2020.

Executive Summary

This building has been rated against the new building standard for a normal structure which is regarded as Importance Level 2 (IL2) in accordance with NZS1170.5:2004.

The assessed potential earthquake rating is 34%NBS (IL2) in both the longitudinal and transverse directions, which gives it a seismic 'Grade C'. Therefore, the potential status of the building in terms of life-safety is Earthquake Risk and not Earthquake Prone.

A "Severe Structural Weakness" (SSW) is a structural weakness for which rupture would lead to a catastrophic collapse. No Severe Structural Weaknesses have been identified.

The Initial Seismic Assessment (ISA) is considered to provide a relatively quick, high-level and qualitative measure of the building's performance. A more reliable result would be obtained from a Detailed Seismic Assessment (DSA). A DSA could find structural aspects of concern that have not been identified from the IEP. Alternatively, a detailed structural assessment may show that structural aspects of potential concern identified in this IEP may have in fact been addressed in the design of the building.

Introduction

Hutt City Council has engaged Sawrey Consulting Engineers Ltd (SCEL) to carry out an Initial Seismic Assessment (ISA) of the changing rooms and toilets building at Richard Prouse Park, located at 87A Hine Road, Wainuiomata, Lower Hutt. This ISA is based on the Initial Evaluation Procedure (IEP) as defined in *Technical Guidelines for Engineering Assessments* referenced above.

Earthquake Prone Building (EPB) methodology is used to identify earthquake-prone buildings, and has been produced by the Ministry of Business, Innovation and Employment in accordance with the Building Act 2004. This ISA meets the requirements of an engineering assessment as prescribed in the EPB methodology.

Background to the IEP and Its Limitations

The IEP procedure was developed in 2006 by the New Zealand Society for Earthquake Engineering (NZSEE) and updated in 2017 to reflect experience with its application and also as a result of experience from the Canterbury earthquakes of 2010/11. It is a tool to assign a percentage of New Building Standard (%NBS) rating and associated grade to a building as part of an Initial Seismic Assessment of existing buildings.

The IEP enables building owners and managers to review their building stock as part of an overall risk management process.

Characteristics and limitations of the IEP include:

- An IEP assessment is primarily concerned with life safety. It does not consider the susceptibility
 of the building to damage, and therefore to economic losses.
- It tends to be somewhat conservative, identifying some buildings as earthquake prone, or having a lower %NBS score, which subsequent detailed investigation may indicate is less than actual performance. However, there will be exceptions, particularly when potential critical structural weaknesses (CSWs) are present that have not been recognised from the level of investigation employed.
- An IEP can be undertaken with variable levels of available information: e.g. exterior only inspection, structural drawings available or not, interior inspection, etc. The more information available, the more representative the IEP result is likely to be. The IEP records the information that has formed the basis of the assessment and consideration of this is important when determining the likely reliability of the result.
- It is an initial, first-stage review. Buildings or specific issues which the IEP process flags as being problematic or as potentially critical structural weaknesses need further detailed investigation and evaluation. A Detailed Seismic Assessment is recommended if the seismic status of a building is critical to any decision making.
- The IEP assumes that buildings have been designed and built in accordance with the building standard and good practice current at the time. In some instances, a building may include design features ahead of its time, leading to better than predicted performance. Conversely, some unidentified design or construction issues not picked up by the IEP process may result in the building performing not as well as predicted.

- It is a largely qualitative process and should be undertaken or overseen by an experienced engineer. It involves considerable knowledge of the earthquake behaviour of buildings, and judgement as to key attributes and their effect on building performance. Consequently, it is possible that the %NBS derived for a building by independent experienced engineers may differ.
- An IEP may over-penalise some apparently critical features which could have been satisfactorily taken into account in the design.
- An IEP does not take into account the seismic performance of non-structural items such as ceilings, plant, services or general glazing that are not considered to present a significant life safety hazard.

Experience to date is that the IEP is a useful tool to identify potential issues and expected overall performance of a building in an earthquake. However, the process and the associated %NBS rating and grade should be considered as only providing an indication of the building's compliance with current code requirements. A detailed investigation and analysis of the building will typically be required to provide a definitive assessment.

Basis for the Assessment

The information we have used for our IEP assessment includes:

- The building appears to have been constructed in 1969.
- Subsoil class D has been used based on GNS Science's Lower Hutt Valley Site Subsoil Class Map and our engineering judgment.
- The period has been determined as being less than 0.40 seconds, based on the reinforced masonry shear wall structure.
- A Hazard Scaling Factor of Z = 0.4 has been used based on the location of the site in Wainuiomata.
- The building has been assumed to have an Importance Level 2 (normal structures).
- A ductility factor of μ = 2.0 has been assumed based on the reinforced masonry shear wall structure.

The key assumptions made during our assessment are shown in Table 1 that follows.

Table 1: IEP Assumptions

IEP Item	Assumption	Justification			
Date of Building Design	1969	Date of Building Permit			
Soil Type	D	GNS Science's Lower Hutt Valley Site Subsoil Class Map and ou engineering judgment			
Building Importance Level	2	AS/NZS1170.0			
Ductility of Structure	2.0	Reinforced masonry shear wall structure.			
Plan Irregularity Factor, A	1.0	Insignificant			
Vertical Irregularity Factor, B	1.0	Insignificant			
Short Columns Factor, C	1.0	Insignificant			
Pounding Factor, D	1.0	Insignificant			
Site Characteristics	1.0	Insignificant – Greater Wellington GIS viewer indicates low liquefaction potential			
Factor F	1.0	Building is in reasonable condition. Single storey with well distributed shear walls. Calculations carried out to check block walls out-of-plane and columns cantilevering above block walls using relatively conservative assumptions for reinforcement due to lack of available drawings to review.			

Building Description

The building is single storey and appears to have been constructed in 1969 (based on the date of the building permit issued). No drawings were available for perusal.

The roof is monoslope, with corrugated iron supported on timber purlins, which in turn are supported by steel I-beams. The steel I-beams span the width of the building and are supported by 300mm x 300mm concrete columns. There are eight columns in total - four on each side of the building. At the high side of the building, the columns cantilever approximately 800mm above the top of the block walls and there are clerestorey windows above the block walls between the columns.

The external walls are 190mm thick blockwork between the concrete columns. The internal walls are a mix of 190mm and 140mm thick blockwork. Some of the block walls have returns, but others do no and are vertical cantilevers.

There is a concrete floor slab. It is assumed the foundations consist of shallow footings.

IEP Assessment Result

Our IEP assessment of this building indicates the building achieves 34%NBS (IL2) in both the longitudinal and transverse directions. The IEP assessment of this building therefore indicates an overall earthquake rating of 34%NBS (IL2), corresponding to a 'Grade C' building as defined by the New Zealand Society for Earthquake Engineering (NZSEE) building grading scheme. This is above the threshold for Earthquake Prone Buildings (34%NBS), but below the threshold for Earthquake Risk Buildings (67%NBS) as recommended by the NZSEE.

The key assumptions made during our assessment are shown in Table 1 above. Refer also to the attached IEP assessment and ISA technical summary report.

IEP Grades and Relative Risk

NZSEE (which provides authoritative advice to the legislation makers and should be considered to represent the consensus view of New Zealand structural engineers) classifies buildings achieving greater than 67%NBS as "low or medium risk" and having "acceptable (improvement may be desirable)" building structural performance.

Table 2 taken from the Technical Guidelines referred to earlier provides the basis for a proposed grading system for existing buildings, as one way of interpreting the %NBS earthquake rating.

This building has been classified by the IEP as a 'Grade C' building and is therefore considered to be a medium life-safety risk.

Building Percentage of New Approx. Risk Relative Life-safety Risk Grade **Building Strength** to a New Building **Description** (%NBS) >100 <1 low risk A+ 1 to 2 times 80 to 100 low risk Α 67 to 79 2 to 5 times low or medium risk В 34 to 66 5 to 10 times medium risk C 20 to 33 10 to 25 times high risk D <20 more than 25 times very high risk Ε

Table 2: Relative Earthquake Risk

Seismic Restraint of Non-Structural Items

During an earthquake, the safety of people can be put at risk due to non-structural items falling on them. These items should be adequately seismically restrained, where possible, to the NZS 4219:2009 "The Seismic Performance of Engineering Systems in Buildings".

An assessment has not been made of bracing of the ceilings, services and plant. We have also not checked whether tall or heavy furniture has been seismically restrained or not. These issues are outside the scope of this initial assessment but could be the subject of another investigation.

Conclusion

Our ISA assessment for this building, carried out using the IEP indicates an overall score of 34%NBS (IL2), which corresponds to a 'Grade C' building, as defined by the NZSEE building grading scheme. This is above the threshold for Earthquake Prone Buildings (34%NBS), but below the threshold for Earthquake Risk Buildings (67%NBS) as recommended by the NZSEE.

The ISA is considered to provide a relatively quick, high-level and qualitative measure of the building's performance. In order to confirm the seismic performance of this building with more reliability you may wish to request a Detailed Seismic Assessment (DSA).

A DSA would also investigate other potential weaknesses that may not have been considered in the initial seismic assessment.

We note that a geotechnical desktop study would be required as part of a DSA.

We trust this letter and initial seismic assessment meets your current requirements. We would be pleased to discuss further with you any issues raised in this report. Please do not hesitate to contact us if you would like clarification of any aspect of this letter.

Yours faithfully

SAWREY CONSULTING ENGINEERS LTD

WARNING!! This initial evaluation has been carried out solely as an initial seismic assessment of the building following the procedure set out in "The Seismic Assessment of Existing Buildings" Technical Guidelines for Engineering Assessments, July 2017. This spreadsheet must be read in conjunction with the limitations set out in the accompanying report, and should not be relied on by any party for any other purpose. Detailed inspections and engineering calculations, or engineering judgements based on them, have not been undertaken, and these may lead to a different result or seismic grade.

Initial Evaluation Procedure (IEP) Assessment - Completed for Hutt City Council

Table IEP-5 Initial Evaluation Procedure Step 8

Step 8 - Identification of potential Severe Structural Weaknesses (SSWs) that could result in significant risk to a significant number of occupants

- 8.1 Number of storeys above ground level
- 8.2 Presence of heavy concrete floors and/or concrete roof? (Y/N)

1

Potential Severe Structural Weaknesses (SSWs):

Note: Options that are greyed out are not applicable and need not be considered.

Occupancy not considered to be significant - no further consideration required

Risk not considered to be significant - no further consideration required

The following potential Severe Structural Weaknesses (SSWs) have been identified in the building that could result in significant risk to a significant number of occupants.

- 1. None identified
- 2. Weak or soft storey (except top storey)
- 3. Brittle columns and/or beam-column joints the deformations of which are not constrained by other structural elements
- 4. Flat slab buildings with lateral capacity reliant on low ductility slab-to-column
- 5. No identifiable connection between primary structure and diaphragms
- 6. Ledge and gap stairs

IEP Assessment Confirmed by
