Delivery of Ngau Matau

The delivery of Ngau Matau will be split into two separable portions as follows:

— Separable portion 1:

All works in the coastal marine area and the construction of the shared pathway south of chainage 570m; and

- Separable portion 2:

All works in the northern portion of Ngau Matau in proximity to CentrePort's compound at Ngau Matau noth of chainage 570m.

Works will be split into two separable portions as the CentrePort compound will continue to be used beyond the practical date of completion for Tupua Horo Nuku. This continued use of the compound is essential for the delivery of the Seaview Wharf upgrades and replacement of the fuel pipeline in this area.

The approximate timeframe for construction of the two separable portions will be:

— Separable portion 1:

September 2024 to March 2025

- Separable portion 2:

TBC following the completion of the Seaview Wharf and pipeline upgrade works.

In the interim and prior to the construction of separable portion 2, shared path users will continue to use the existing pathway that has been created by CentrePort to provide a pathway for users in proximity to their compound and cyclists will also be able to use the roadside.

All design and construction information provided by the Te Ara Tupua Alliance to GWRC and HCC in respect of Ngau Matau includes the final design and construction details for both separable portion 1 and 2'.

Tupua Horo Nuku **Eastern Bays**

The Eastern Bay area encapsulates many wahi tapu from Te kongutu o Te Awa Kairangi to Te Waha o te Ikanui. Its beginnings emanate out of the power and mana of Tupua-horo-nuku (evolving mass of solid matter), known as the tupua, Ngake.

Instructed by the mountain clan people who were summoned to the head of the fish, gathering on Pukeatua where they were gifted the appropriate incantations to prise open the mouth of the great catch of Māui-tikitiki-a-Taranga to enable it to breathe again, where they summoned from the great depths of Rua Tupua and Rua Tawhito of the fresh water lake who brought forth Tupuahoro-nuku and Tupua-horo-rangi.

Tupua-horo-nuku, Tupua-horo-rangi Tai kukume mai takiwā ia mouri e runga Kia horo wawe mouri e raro koi ikaroa¹

The narrative of the eastern bay speaks of and highlights "te ihi, te wehi me te mana nui o Tupua-horo-nuku."

Te Awa Kairangi, formed out of the raging whip lashing tail of Ngake as he wound himself up into a frenzy, generating and amassing energy and power, splitting the land mass immediately behind him lacerating Papatūānuku, imbuing "te ara mouri" inland to the Tararua and Remutaka. Whilst at the same time hurling himself towards the barriers hearing the pounding and thunderous waves smashing in the distant. Smashing his way out from his land lock imprisonment to freedom unto Hinemoana and

1 He karakia nō te kainga

Tangaroa. In his destructive escape came forth the islands of the harbour later to be named by Kupe the pacific navigator, and as centuries passed the peopling of Te Wai-manga arrived gifting new names later to be suppressed through imperialistic and colonial methodologies which are still impacting on us since their arrival in 1769.

Tēnei te ara kei runga Tēnei te ara ō Ranginui e tū nei Tēnei te ara o Papatūānuku e takoto nei...²

Ripiripia te ika nui Haehaea te ika roa Ka hora, ka hora te kai ki a Tamanuiterā Ka hora, ka hora te kai ki a Tāwhiri-mātea...³

Immediately following the severing, Hine-wai-tootaa and Hinekorako went about their duties caressing and gently healing Papatūānuku. Calling upon their sister Hine-wairere they asked her if she could follow the scarification marks of Papatūānuku until she was fully covered to sooth her skin to ease the pain. To this day they still nurture and care for her.

Te Awa Kairangi like many rivers began its life through the kuia Hine-wai-tota, Hine-kōrako and Hine- wairere, being the ancestress of condensation, lunar droplets and water flow gathering on the many peaks on both sides of the river. Fed by melting snow, ice and rainwater running off the land, the collective lake imprisonment.

The many small tributaries joining together growing larger forming the collective mass of Te Awakairangi, flowing every second of the day. The following whakatauaaki encapsulates who the people of Te Ātiawa are and our responsibility for the water and the whenua.

Te Ātiawa tupua rau, he auripo i te manga iti, he auripo i te manga nui rānei, he kaitiaki ki te whenua⁴

land.

Over time the continuous flow of Te Awa Kairangi has shaped the landscape moving and wearing away rock, carving out a network of valleys eventually reaching the lower grounds, widening and reaching the point where the fresh water meets the salt water.

Whakapakarukaru puare te waha o te ika roa Te hononga o ngā wai e rua...⁵

The Eastern Bay commences at the meeting of the waters.

of droplets follows cracks and crevices within the landscape formed out of the raging whip lashing of the tail of Ngake (seismic activity) in his attempt to escape to freedom from his land lock

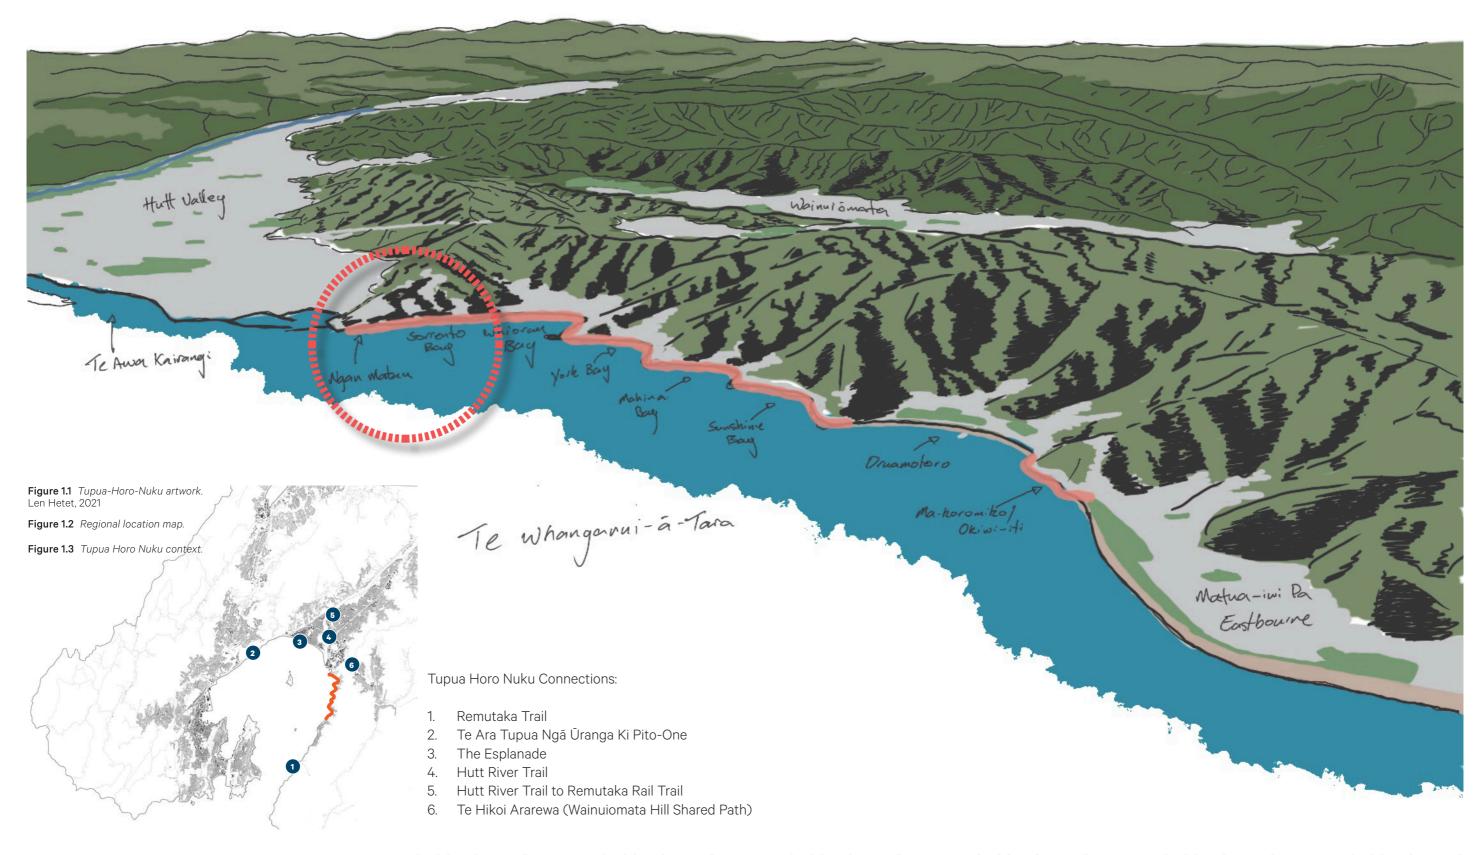

Te Atiawa of many phenomena's, where there is a ripple in a small tributary or great river, there is a guardian and protector on the

Tupua Horo Nuku The Pathway

Tupua Horo Nuku. Ngau Matau & Sorrento Bay Urban Design Plans. 10 July 2024.

Introduction

Purpose & Objectives

The purpose of the Bay Specific Urban Design Plan (BSUDP) is to provide bay specific detailed design for the project responding to local landscape character, identity and land use, in the broader context of the Landscape and Urban Design Plan (LUDP).

Consent conditions for the Eastern Bays Shared Path (Tupua Horo Nuku) guide the content of the BSUDP and the preceding LUDP. The conditions outline the purpose of the management plans, the contents of the plans, expert inputs, stakeholders to be consulted, the approval and certification process and how to manage disputes. Community aspirations, engineering constraints with urban design and landscape layers are applied to achieve a unique bay specific design, integrated with the Eastern Bays Shared Pathway.

Relevant Consent Conditions

LV.5 The LUDP shall include the final BSUDPs for each bay within the Project area. The final BSUDPs shall address detailed design within the particular bay for the benefit of pedestrians, cyclists and others using the local road network as well as the specific urban design, landscape, ecology and recreational amenity matters (including those listed in Condition LV.7) as relevant to the particular bay.

The final BSUDPs may be prepared later and added to the LUDP on a staged basis if the Construction Works are staged bay by bay and individually certified under Condition LV.6.

LV.6 The BSUDPs shall be prepared by the Consent Holder in two stages for each bay:

(a) Stage 1: A draft design protocol that sets out the priorities for the bay design in terms of engineering, safety and access and mobility requirements as well as ecology, natural character, landscape, urban design and recreational amenity elements and issues. The draft design protocol shall provide visual representations of best practice on comparable coastal Shared Path projects

to demonstrate the level of design to be targeted. The protocol shall be provided to the relevant Resident Association for the affected bay (if any). The East Harbour Environment Association and the Eastbourne Community Board for comments (if any) within 15 working days from receipt.

Any comments received, and the Consents Holder's response and reasons if they are not accepted, are to be provided to the Manager, Environmental Regulation, and Team Leader, Resource Consents alongside the draft design protocol, within 20 working days from receipt of the comments.

(b) Stage 2: The final BSUDPs are to be certified either on their own (in accordance with Condition GC.5) or, if included in the initial LUDP, when the LUPD is certified under Condition LV.1.

LV.7 The BSUDPs shall include specific landscape and urban design details for:

- (a) Seawall structures, including transition zones between seawall types and transitions between natural or rocky areas and seawall structures;
- (b) Beach access including steps, ramps and associated handrails where required, so that people wishing to access the beach can do see safely;
- (c) Safety barriers and railing and screening barriers between important habitat for Shoreline Foragers and the Shared Path;
- (d) The treatment of stormwater structures at the coastal interface;
- (e) Little Penguin and Shoreline Forager related structures including penguin passage elements, ramps, nests, boxes and wooden poles for roosting;
- (f) Planting treatment;
- (g) The treatment of existing trees and existing landscape and natural features;
- The design and area of space available for recreational amenity activities; (h)
- (i) The design and orientation of features, spaces and access points;
- (j) Refuge and seating opportunities, including size and arrangement of space to allow for stopping and gathering at frequent intervals distributed along the route;
- (k) Signage ensuring their consistency along the Shared Path, including branding and reduction of visual clutter;
- (I) Storyboards;

(m) Surface treatments: (n) Any other relevant matter for that bay necessary to achieve the purposes of the LUDP in condition LV.2.

Structure

In satisfying Conditions LV.5 - LV.7 of the Resource Consent the Draft Design Protocol process informing the BSUDPs is:

- of comparable Shared Path projects.
- Outline landscape and urban design approaches and principles for each bay to set the scene for design plans and details.
- Develop an illustrative schematic plan for each bay.

- Illustrate bay locations and describe the landscape context.

- Ascertain draft priorities for each bay. Priorities include issues involving:
 - safety, access and mobility; engineering; ecology; natural character;
 - landscape; urban design; and recreational and amenity elements.
- Show visual representations of best practice through precedent examples

Consultation

Summary of consultation process

The consultation process for Whiorau/Lowry & Sorrento Bay was further adapted from the previous consultations to streamline the process without compromising the extent of the engagement.

In accordance with condition LV.6 the consultation on the Bay Specific Urban Design Plans will be completed by providing the draft Design Protocol to the specified groups. Concurrently to this, the plans will also be published on the Hutt City Council website to allow for feedback from the wider public.

This consultation is for bays 1 and 2 of Tupua Horo Nuku. It gives residents and relevant interest groups the chance to have their say on the elements of the designs. If required, this may lead to a subsequent consultation period.

Prior to the release of the draft protocols, a meeting will be set up between representatives of the Alliance and named organisations.

- 1. Set meeting between Alliance and named organisations
- 2. Send BSUDP consultation and note 15 working day timeframe for comments. Draft BSUDPs also published online via Hutt City Council HaveYourSay engagement website.
- 3. Create comments and responses document within 20 working days
- 4. Update BSUDP
- 5. Submit for certification.

After the first round of consultation, the Alliance felt that all matters raised had been appropriately addressed. Therefore, the team did not proceed with a subsequent consultation.

Tupua Horo Nuku.

Consultation Matrix

Summary Table.

08.

| Location | Comment Title | Raised by | Desciption | Project Team Response |
|-----------------|-----------------------------|--------------------|---|---|
| General | Bus stops | EHEA | Not convinced design is satisfactory for exposed coastal condition. Request meeting with alliance reps, GWRC and Metlink to discuss design. | A standardised design is required by GWRC with potential for adaptations to suit the conditions within th Due to the size and nature of the existing shelters, it was determined that the new shelters provided great well as improved visibility and safety for users. |
| | | | Bus shelter design needs more protection from weather, waves, etc than the | The existing bus shelters will now be replaced with standard GWRC shelters. These will, to the greatest e design principles: |
| | | ECB | standard design provides, especially at ground level. | (a) A preference that the shared path run behind the bus stop/ shelter; (b) The bus stop / shelter will be raised (separated with a kerb from the traffic lane where possible); (c) The bus stop / shelter will be designed in accordance with universal accessibility principles (such as, (d) Bus stop / shelter design will be fit for purpose to appropriately protect public transport users from the |
| | | | | With these principles in mind, the standard GWRC shelter will be used. The entrance point will be modified |
| General | Bus stops | EHEA | Support raised pedestrian crossings at bus stops. | Noted. The request for a raised pedestrian crossing is out of scope for the Alliance and has been passed on to H |
| General | Path width at bus stops | EHEA | If there's 1.2m of path in front of bus stops, can path be narrowed behind to 2 or 1.5m to reduce impact on CMA or increase depth of shelter? | Not accepted. To provide a safe path along the length of Tupua Horo Nuku, the minimum width of 2.5m needs to be ma such as bus stops. |
| General | Bus stops / place making | EHEA | Current bus stops are unique designs. Can new bus stops be painted in unique way to represent each bay? | Not Accepted. The inclusion of bus stop artwork is not within the Alliance's scope. |
| | | Online feedback | Glass bus stops are graffiti prone, concern these will be quickly defaced. Can we make them more visually interesting as a deterrent? | |
| Pt Howard | Bus stop | PHRA | Can we have crossing access for wheelchair users near bus stop? | Accepted The bus stop and pathway design consider accessibility for wheelchair users. |
| Pt Howard beach | Bus stop | Online | Can cycle racks be placed between the bus stop and pedestrian crossing for beach users and people stopping for a toilet break? provide benches or seats facing the sea. | Partially accepted. The request for cycle racks at the bus shelter will be considered where space allows. While no seating is proposed at the bus shelter, there is some in Ngau Matau / Pt Howard. The request to |
| General | Bus stop | Online | Comment to support switching to standard bus stops. | Noted. |
| | | | Comment to support path going behind bus stops. | |
| General | Balustrades | EHEA | Balustrades will get damaged in large storm events, can they have a modular design so they're cheap/easy to replace? | Partially accepted. The barrier is not modular but parts that get damaged can be replaced with ease. All the balustrades are angled seaward with an inner rub rail. |
| | | Orlin | Can they be angled outwards with inner rail for cyclists? | The Balustrade has been designed to meet New Zealand standards for wind loading and is a permeable |
| | | Online feedback | Consider balustrade on seaward side of the shared path from the ramp to the steps at Pt Howard Beach | Balustrades are under review as part of a safety review. All balustrades required from this review will be a |

n the bay.

reater accessibility (by being able to provide ramps and a platform), as

est extent practicable, be designed taking into account the following

as, but not limited to, wheelchair friendly ramps and tactile pavers); and m the coastal elements under relatively frequent events.

lified to provide further protection from the elements.

to HCC for future consideration.

maintained. This is particularly important at potential conflict zones,

t to have them facing the sea will also be considered.

ble structure to minimise damage under extreme wave loading events. be a suitable length to protect path users.

| Location | Comment Title | Raised by | Desciption | Project Team Response |
|--------------|----------------------|-----------|---|--|
| Sorrento Bay | Bird Protection Area | EHEA | Fence may be at risk in bad weather and would be opaque to cyclists/walkers. | Not accepted. |
| | | | What's the design brief? Dogs should be on leash, 1.2m height should be sufficient. | Oystercatchers can be disturbed by noise and visual activity, so the 1.8m height helps to screen path us protection is required under the resource consent conditions. The height, materials and extent of the bar resource consent conditions (the required protections are different to the fence at Whiorau Reserve, where the test of test |
| | | | Can the fence have a rail similar to balustrades in Days Bay? | The bird screen has been designed to meet New Zealand standards for wind loading. |
| | | | Can fence be made similar to the balustrade between Pt Howard and Lowry Bay – i.e. using panels designed to keep dogs out? | Maintenance of the bird protection screen will be required after some significant storm events. The mat vertical palings. A rub rail will be included on the inside face of the fence where there is a risk to path users. |
| Sorrento Bay | Bird Protection Area | ECB | Oystercatchers use island beside blue boat shed, is fence in the right place? | Partially accepted. The extent of the fence location will meet the consent requirements and advice of project ecologists. |
| | | | Should not be fishing area by the boat shed. | |
| | | Online | Prohibit dogs from the whole area including the area circled in red. | Prohibiting dogs from the area is a matter for further HCC consideration. |
| | | | Do not carry out the construction in Q4. Recommend starting path construction | We are developing the construction programme to account for no construction during breeding season |
| | | | in Q2. | |
| Sorrento Bay | Bird Protection Area | PHRA | Oystercatchers nest near the blue boat shed, current protections unlikely to offer them any great protection. | To ensure the protection of torea pango/oystercatchers, the fence location will meet the consent require |
| | | | | Oystercatchers can be disturbed by visual activity, so the 1.8m height of the fence helps to screen path |
| | | Online | If the blue boat shed is removed, consider moving BPA protections to that side. | Bird protection areas help protect important bird populations and mitigate habitat loss. This is why they |
| | | feedback | Should not be fishing area by the boat shed. | Parking is removed as part of the protection measures. |
| | | | Is the fence needed where shown? It removes beach access. | |
| | | | Can we build offshore habitat rather than have the screening fence? | |
| | | | Then we can retain trees there for shade amenity. | |
| | | | 1.2m high fence is preferable to 1.8m. | |
| | | | Do we need to lose parking? | |
| General | Penguins | EHEA | Can safe passage under the road / low fences to keep penguins off road be shown on the plan? | Accepted. Penguin barriers will be drawn on stage 2 plans for Pt Howard. No penguin barriers are included in Lown access for penguins. |
| | | | | Measures will be put in place so that penguins can continue using culverts during construction. |
| Sorrento Bay | Culverts under road | Online | Can we include additional pipes or equivalent under the road for penguins to use and nest in? | Not accepted. We are keeping all existing culverts as a means of access for penguins. |
| | | | | Installing additional pipes under the road is outside of the scope of this project. |
| General | Patterns on path | EHEA | Can some of the patterns to be etched on the path be designed by locals/ residents? | Not accepted. Working alongside our mana whenua partners the urban design and cultural narratives including decora artists, to convey the cultural narrative appropriately. |
| | | | | · · · · / |

Summary Table.

| Location | Comment Title | Raised by | Desciption | Project Team Response |
|-----------|----------------------|--------------------|---|---|
| Pt Howard | Existing ramp to sea | EHEA | This ramp gets slippery. Can the surface be improved and a handrail added? | Not accepted. Modification of this ramp, including handrails and surface treatment, is not included in the scope of this p |
| | | PHRA | Can we look at moving the ramp at the west end of Pt Howard beach further west to help fight erosion? Present ramp is too steep for safe access for most beach users and is unsuitable for kayaks, small watercraft, etc. | Modification of this ramp was specifically excluded from the resource consent application. |
| General | Beach nourishment | EHEA | Needs long term plan to maintain – could rocks be strategically placed at beach ends to help retention? | Not Accepted. The resource consents do not allow for any additional engineering modifications (e.g. groynes). The seav over the design life of the seawall. |
| | | | | Modelling indicates that material will be relatively stable in the short- to medium-term. It is acknowledged and gradual depletion if not managed (i.e. replenished). |
| | Beach nourishment | PHRA | This is unlikely to be successful at Pt Howard beach long term due to weather/ wind/tides. | Noted. The beach nourishment plan was designed in consultation with a specialist coastal engineer. |
| | | Online feedback | It should be done on an 'experimental approach' in small quantities in consultation with coastal marine process experts. | The existing beach is partially constrained by rocky outcrops (either side and offshore) which provides so Our modelling indicates that material will be relatively stable in the short- to medium-term, providing the lost due to sea level rise and gradual depletion if not managed (i.e. replenished). Access for re-nourishment of the beach has been considered as part of the beach nourishment manager |
| | | IEEUDACK | Comment for ongoing nourishment. Will this increase maintenance for the shared path? | It is not expected that the new seawall or beach nourishment will increase the quantity or frequency of su However, the impact of future sea level rise on the storm events is uncertain and this may increase the au carriageway. |
| General | Beach access | EHEA | Looks good, please review whether they align with local requirements, minimise congestion, encourage pedestrians to go to the beach, good to have beach access near bus stops for waiting commuters. | The shared path will form part of HCC's standard maintenance programme for the wider city. Noted. Beach access points attempt to balance a number of factors, including those mentioned here. |
| | Beach access | Online | Can we have two access points – north and south, with access for kayaks, paddle boards, etc. | Partially accepted. A ramp and a set of stairs are provided on Sorrento Bay beach to replace the existing access. There is an |
| | | | Comment for retaining steps in existing location at Pt Howard beach with a handrail – this is the best place for beach access. | Access at the southeastern end of Sorrento Bay cannot be provided because of the tōrea pango/oysterc There are steps at Sorrento Bay beach. |
| | | | Comment for steps at Sorrento Bay beach. | |
| General | Stair design | ECB | Standard step design has corners which makes it tricky to take kayaks, wheelchairs, prams, etc down. Can we add straight flights of steps and 'small ramp systems'? | Not accepted. The turn in the stairs is designed to reduce impact on the beach area. A straight design would pave over accessibility. |
| | | PHRA | | Ramps are provided to allow for kayak and wheelchair access at some locations. |
| General | Construction info | ECB | Want to know about beach access during construction period, provisions made to minimise beach access impact on residents, info about location of construction base areas (lockups, toilets, etc) given length of time construction is | Noted. The Alliance team will proactively inform the ECB and the community of timeframes and locations of wor |
| | | online | planned for Pt Howard to Lowry Bay. Pt Howard beach usage peaks from December to April, please schedule construction from April/May. | Construction at Pt Howard is not scheduled until after the completion of Sunshine Bay. It's unlikely to be |

Summary Table.

| Location | Comment Title | Raised by | Desciption | Project Team Response |
|-----------------|---|-----------|--|---|
| Pt Howard | Impact of path width and seawall on beach | PHRA | Predicted sea level rise and the shared pathway will reduce the amount of usable beach in future. | Not accepted. To provide a safe path width of 2.5m, some coastal area needs to be used to build the seawall. This was c consents were gained for the project. |
| | | | Please consider a narrower width to limit impact on beaches in the area (this is similar to path north of Ngau Matau, and near Estuary Bridge). | Some beaches along the eastern bays will receive beach nourishment. This will build up the current beac Nourishment is proposed at Sorrento Bay. |
| | | | If path can be narrowed for the boat shed, can it be narrowed to protect the beach? | The future of the blue boat shed is being discussed with the land occupier. HCC will consult separately o may have on the path. |
| | | | Can a single seawall be used at Pt Howard beach to reduce impact on beach? | The tiered seawall is proposed to minimise wave overtopping of the seawall and minimise the length of b |
| | | | | The seawall height (and number of tiers) is dictated by the difference between the road and rock levels. |
| Pt Howard | Road/ traffic lanes | PHRA | Could lanes west of Pt Howard pedestrian crossing be shifted north by 0.5m or narrowed slightly with speed restrictions? | Not accepted. Altering road lanes is outside of the scope of this project. |
| | | | | Any speed limit changes will be considered as part of HCC's speed reviews. |
| Pt Howard beach | Vehicle guardrail | PHRA | What is the value of the vehicle guardrail located along western section of Pt Howard Beach (approx. 50m in length?) | The road safety barrier is proposed to be removed as part of the shared path works. |
| | | | Can it be removed with speed lowered from 50km/h? | Changes to road speed limits are outside the scope of Tupua Horo Nuku and will be addressed through H |
| Pt Howard | Car parks | PHRA | Parallel parking beside Pt Howard does not make sense as it reduces parking at a premium spot and necessitates a u-turn by all traffic coming in from the north. | Parking at Point Howard was assessed through an options assessment and agreed with HCC. |
| | | Online | Please ensure there is adequate parking long term with Centreport. | Currently, on-street parking is informal, with no parking spaces marked. It is estimated that up to nine car accordance with design standards, would result in seven angled parking spaces. The design for parallel p |
| | | Feedback | Conduct a study to determine parking demand, usage times, etc so that the lay out is optimal at Pt Howard. | Parking alignments evaluated in the options assessment were 90 degree, 45 degree, 30 degree and para functionality of the types of parking, parallel parks provided the best balance of: |
| | | | Comment to remove more car parks to improve design. | |
| | | | Comment to support proposed removal of parks. | minimum path width requirements, minimum coastal area encroachment, required parking bay dimensions and protection of animal habitat. The Pt Howard (Centreport) parking area is subject to further consultation between Centreport and HCC |
| Pt Howard | Revetment repair | PHRA | Can we remove old concrete near Pt Howard bus stop as part of revetment repair? Crush it and fill space in with seats/trees? | Not accepted. There are limits to the permitted modification of this revetment as part of the consented works. Some rehabilitation of the revetment is proposed. |
| Pt Howard | Rings for tying up kayaks/boats | PHRA | Can there be ring attachments on seawall at the beach for tying kayaks, etc, up? | Not accepted. The precast concrete design does not allow for any brackets or rings to be installed. Ring attachments could be installed at a later date. Reinforcement in the seawall would need to be avoide term is not compromised. |
| Pt Howard | Beach facilities | PHRA | Can we have facilities at Pt Howard beach, e.g.: showers, bike racks, etc. Two comments for upgraded changing facilities. Consider adding flotation devices/life rings, automated external defibrillators near beach access/seating at Pt Howard. | Partially accepted. While facilities like showers and flotation devices are not in the scope of this project, cycle racks are inclu Upgrading the changing facility is also outside of the scope of this project. New seats have been added at each rest area/pause point along the shared path, including at bus stops. Other seats have backs, allowing for a more comfortable stay, in areas for reflection. |

| Consent Condition | Response | Page ref |
|--|--|-----------------|
| (c) Safety barriers and railing; | There are no balustrades proposed within Ngau Matau & Sorrento Bay. | Pg 19 |
| (d) The treatment of stormwater structures at the coastal interface; | Stormwater outlets will be in-situ sections between pre-cast wall units. The outlet will sit within the curved seawall via a concrete housing which visually integrates the pipe to the seawall. | Pg 19 |
| (e) Little Penguin and Shore Forager related structures including penguin passage elements, ramps, and wooden poles for roosting; | Where rock revetment is repaired a small fence is proposed to stop penguins from accessing the path and road. | Pg 21 |
| (f) Planting treatment; | Planting areas are located around refuge points and headlands to soften and enhance features. Plant species will be chosen from the Plant Palette within the LUDP that has been developed with the Project Ecologists. | Pg 22 |
| (g) The treatment of existing trees and existing landscape and natural features; | Some trees will need to be removed to accommodate the path and alignment of the bird screening fence. | Pg 12-15, 22 |
| (h) The design and area of space available for recreational amenity activities; | The BSUDP has provided the design and area of space available for recreational and amenity values in accordance with Condition LV.7(h). We consider that our design provides the best solution in the circumstances as it falls within the consented footprint, does not increase the overall CMA reclamation, and provides a useable pathway. | |
| (i) The design and orientation of features, spaces and access points; | Refuge spaces are located to balance user needs, community preference, utilise retained existing trees for their character and amenity benefits, avoid encroachment on beaches as well as fit within CMA consented footprint. We note that creating further refuge spaces and access points would likely increase the area of the coastal marine area occupied and/or reclaimed, which is not authorised by the resource consents. | Pg 12-15, 24-25 |
| (j) Refuge and seating opportunities, including size and arrangement of space to allow for stopping and gathering at frequent intervals distributed along the route; | In Ngau Matau & Sorrento Bay we are utilising the headlands and existing pull over spaces. This helps avoid encroachment into the CMA. | Pg 12-15, 24-25 |
| (k) Signage ensuring their consistency along the Shared Path, including branding and reduction of visual clutter; | Signage will be designed so it is integrated into landscape elements to reduce visual clutter along the Shared Path. This approach is consistent across all bays. | Pg 24-25 |
| (I) Storyboards; | The Alliance is taking a culturally led approach and therefore Mouri markers are used as the main interpretation method for the pathway in Ngau Matau & Pg 26 Sorrento Bay. Consideration of ecological and other local history as a second layer to be shared will be made through the detailed design process. | |
| (m) Surface treatments; | A robust palette of materials is used to ensure visual cohesiveness and quality. Predominantly asphalt with sections of concrete. Concrete will also be used for areas where cultural graphics will be applied to the path. | Pg 26 |
| (n) <u>Consideration of a minimum 3m path width for York Bay</u> only (for a 90 m length south of the existing bus stop; and | N/A | |
| (o) Any other relevant matter for that bay necessary to achieve the purposes of the LUDP in condition LV.2. | The Bird Protection Plan has outlined a number of measures that have been incorporated into the design including barriers, screening, pest control, and planting considerations | Pg 22-23, 27 |

Ngau Matau & Sorrento Bay Urban Design Plan

LV.6 (a)

Features of Ngau Matau & Sorrento Bay:

Sorrento Bay is the first bay along Tupua Horo Nuku and sits between Ngau Matau (Point Howard) and the northern headland of Whiorau Bay (Lowry Bay). The Bay is fairly typical of the surrounding area, with a rocky edge and steep escarpment directly behind Marine Drive.

As a popular swimming and recreation destination because of its sheltered sandy beaches, Sorrento Bay has car parking further towards Ngau Matau. The Bay in its current state provides a sheltered sandy beach, toilet facilities, and a small informal ramp for the likes of kayaks and dinghys. The Bay is partially protected from a northerly swell by offshore rocky reefs. The Bay currently has limited landscape design features such as seating, picnic benches, bins and informational signage.

Almost all housing along the Bay is elevated in the escapement with access to those houses from Howard Drive and a number of private walkways with small garages located directly off Marine Drive. Ngau Matau contains the entry to Centre Ports Seaview Terminal, which includes a long wharf that extends south of Sorrento Bay. Because of this Ngau Matau is a mixture of public and private land sitting on reclaimed land with most of the area being dedicated to traffic and parking. A significant landscape feature in this area is the headland remnant that was likely once part of the main escarpment prior to Marine Drive being formed. This large rocky hill provides a significant threshold into the Eastern Bays and has associated planting, rest areas, mature trees, and likely wind protection.

There are a handful of pohutukawa trees on the coastal side of Marine Drive that are primarily clustered close to each headland. Aside from these trees the edge is predominately hard with little planting. The Bay's southern headland contains a boat shed which is a notable landscape feature for the area and signals the change between Sorrento Bay and Lowry Bay. The southern headland is rocky in nature and contains significant habitat for birds as outlined in the Bird Protection Plan for the area.

Ngau Matau headland, before being called Point Howard, had the traditional name with the meaning of 'bite the fishhook'. It is still a significant fishing spot today as it was for Māori in much earlier times.

Natural character:

In respect of natural character, this was discussed in detail during the resource consent process. The following discussion provides a summary of the impact of the Project on natural character, as well as highlights how different design features of the Project take natural character into account.

The resource consent application assessed the natural character of the Eastern Bays at a wider scale as having a moderate abiotic, biotic and experiential natural character. The Project was considered to have low effects on the wider Eastern Bays coastal landscape.

The impact of the Project at a local level on natural character was considered to depend largely on the final detailing and texture on the curved seawall faces, the material used for beach nourishment, the design response to the local landform where the walls finish at rocky outcrops, and design treatments in the more exposed, untamed areas outside of the beaches. Visual impact was considered to diminish over time because of weathering and as they become familiar features reducing to low adverse effects over time.

Within Ngau Matau & Sorrento Bay (and elsewhere) the Project is in general accordance with the consented approach and retains natural features such as rocky outcrops and beaches keeping the untamed character here intact. The new design occupies existing beaches. However, beach nourishment with appropriate imported sands and fine gravels is expected to maintain the balance of natural character.

Ecological detailing is included on the curved seawall faces consistent with the consent design addressing loss of local natural character relating to perception and experience of the structure, as well as providing habitat opportunity where the wall texture is below high tide level. Marine growth will colonise these areas and it is expected the structure will weather into place. Large boulders from site will be used to ameliorate transitions between seawall types and to cover footing concrete where it occurs. Culvert outfalls penetrate the recurve wall in two locations and require boxing in with a simple exposed aggregate concrete support flush with the recurve and are experienced as part of the greater patterned wall.

Ramps and steps are also finished with exposed pebble aggregate consistent in texture with the beach fine gravels which help to detune the engineered nature of these structures along with fit to landscape and natural character.

Priorities for Ngau Matau & Sorrento Bay

Seawall Structures

LV 7. (a) - Seawall types and transitions

Vertical curved seawalls have been chosen for most of the project area including Sorrento Bay because they deflect wave over-topping most effectively and create a reduced footprint on the foreshore compared to other non-vertical seawalls. This design also offers the flexibility to adapt the design to accommodate sea level rise in the future. Seawalls are required to be rebuilt along the majority of the project area. They are designed to prevent coastal erosion and protect against storm surge and are therefore integral to protecting the Shared Path. The Design Features Report (Stantec, 2019) sets out engineering requirements for the project. The main points can be summarised as:

- The seawall design will help address sea level rise, such as protection to be added on top of the wall in future as required.
- Achieve consistency in the seawall profile throughout the corridor.
- The seawall is to be constructed from reinforced pre-cast concrete units. Construction methodology of the seawall will be determined by site conditions.
- Resilience of the road and underground services was considered in the design.
- Replacement and extensions to storm water pipes through the wall are to be like for like, and finish flush with the face of the seawall.
- Seawall transitions to be integrated to avoid abrupt ends/divisions. Transitions between seawall types, e.g. between single and double will be managed between access points (steps and ramps). Transitions between wall edges and the existing coastal edge, e.g. at headlands, will be softened/integrated with natural rock.
- Width of the Shared Path is to have a 2.5m effective width except for area past the boat shed which is currently design as 1.5m.
- The path surface is to be mixed asphalt and concrete with a 300mm wide concrete strip on the 'sea side' to define the coastal edge.
- The work is to be an improvement on existing conditions throughout the corridor.
- Fall from height safety will be addressed by either a 1.2m landing, where there is room or a balustrade where there is not.

Seawall types in Ngau Matau & Sorrento Bay

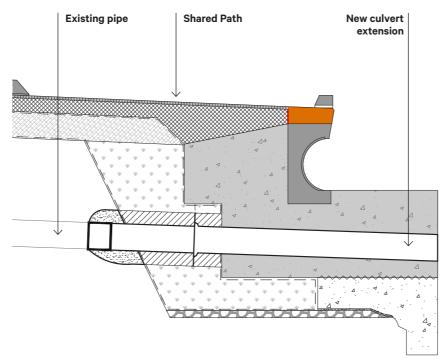

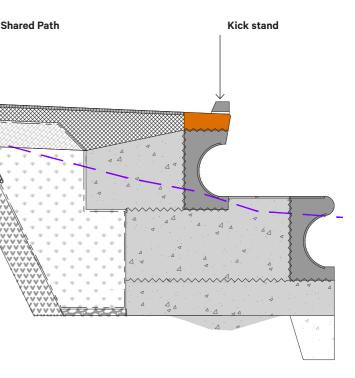

Figure 1.10 Single curved seawall with bench (type C1L) and stormwater outfall penetration.

 For the southern boat shed, the path will be narrowed and shared path installed on the existing hard shoulder. The new seawall will terminate either side of the boat shed and tie into the existing seawall. An in-situ poured concrete facing will be cast against the existing ground to form a transition between the end of the seawall and existing path at the blue boat shed.

Figure 1.11 Double curved seawall with bench (type C2L).

Figure 1.9 Example of existing colonised in situ rock that could be suitable to reuse in the construction of the revetments and transitional areas (stantec).

Tupua Horo Nuku. Ngau Matau & Sorrento Bay Urban Design Plans. 10 July 2024.

Shared Path Balustrade

Figure 1.12 Double curved seawall with Balustrade (type C2).

Stormwater

LV 7. (d) Structures and coastal interface

Storm water outlets will be in-situ sections between pre-cast wall units and are designed to limit adverse effects on recreation.

Beach Access & Safety Barriers

LV 7. (b)(c) - Steps, Ramps & Handrails

An important aspect of the Shared Path is that public access to the beach is maintained and, at certain places, enhanced. Two forms of access are provided to the coastal marine area in Sorrento Bay, these include 'Mini Steps' and 'Ramps'.

is existing.

The design priorities relating to beach access are:

- handrails.
- Steps to be sited in logical, accessible locations with visual links to and from the Shared Path to enable their use.
- expression.
- Parallel design to seawall/coastline to reduce footprint on the beach and interference with coastal processes.
- Fall heights and barriers must comply with NZ Building Code D1 (Access Routes) and F4 (Safety from Falling).
- Provision for safe crossing places and desire lines shall be met as per the Pedestrian Planning and Design Guide (and the Pedestrian Network Guidance (Waka Kotahi, 2021) forthcoming).
- Consideration for the safety of sea birds and animals shall be informed by designed elements and interventions.
- to occur.

Tupua Horo Nuku. Ngau Matau & Sorrento Bay Urban Design Plans. 10 July 2024.

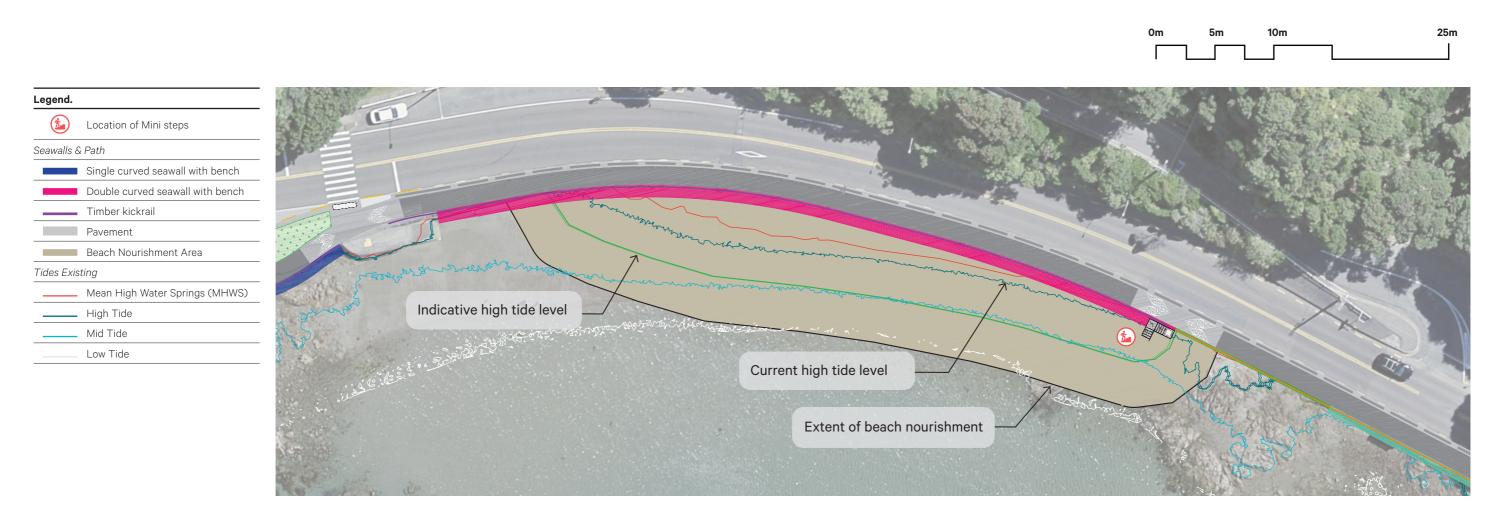

Mini steps are proposed to provide additional access to the beach without encroaching unnecessarily onto the coastal marine area. Ramps are proposed to minimise encroachment onto the beach. The ramp shown in Sorrento Bay

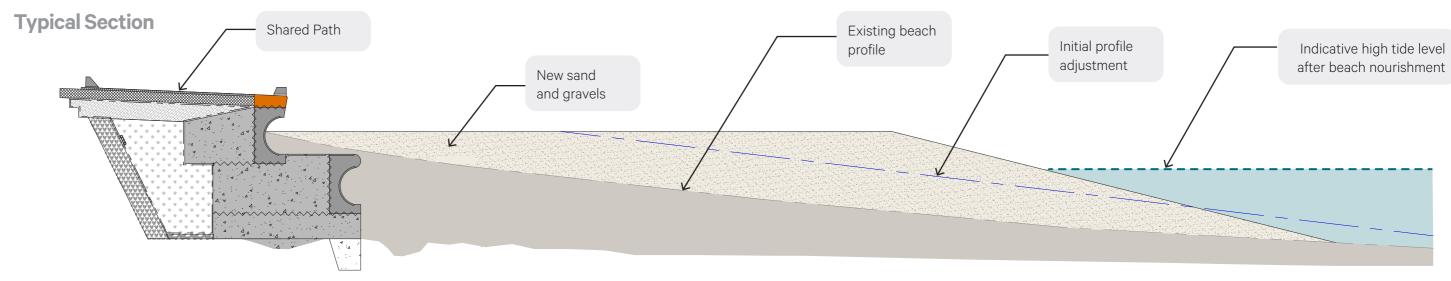

- Should draw people to the coastal edge.
- Should be inviting and intentionally separate to the main path.
- Fit for purpose, using materials suitable for the marine context.
- Safety in design, considering ease of use, surface texture/grip and
- Design to reflect a distinctly Tupua Horo Nuku aesthetic, fitting in with the surroundings while providing opportunity for unique, place based
- Sight lines shall be maintained and unobscured as per CPTED (Crime Prevention Through Environmental Design) guidelines.

- Where stainless steel is used, some minor staining (tea bagging) is likely

Priorities for Ngau Matau & Sorrento Bay

26.

Tupua Horo Nuku. Ngau Matau & Sorrento Bay Urban Design Plans. 10 July 2024.

Beach Nourishment

LV 7. (o) - Other matters

The effects of Tupua Horo Nuku on recreation and loss of amenity value are mitigated by placing beach nourishment at Sorrento Bay. By addressing adverse effects on this beach with 'dry' high tide areas used for sitting and other 'dry' beach activities, the proposal will maintain coastal amenity and ensure effects are no more than minor. Losses in the width of beach - where nourishment is not proposed – and at rocky areas, are minimised by relying on a narrowed path where appropriate.

- Sand and gravel beach material brought onto site.
- 1:4 profile to crest of new beach.
- Approximately 10m max of beach depth. Depth varies as it ties into proposed seawalls.

Ecology

LV 7. (e) - Little penguins, rock pools, barriers

An ecology assessment of intertidal ecology was undertaken in 2016-2017 by EOS Ecology (McMurtrie & Brennan, 2019a). The assessment found that the existing intertidal environment is currently highly modified, with seawalls along the majority of the shoreline consisting primarily of angled concrete seawalls that support low species diversity and richness. Beach areas and fish passage issues have been summarized in the LUDP. Seabird protection is detailed in the Bird Protection Plan.

The main design aspects that will help to improve intertidal ecology and fish passage include:

- A texture applied to the curved seawalls the curved vertical surface and horizontal flat steps and the vertical sides of access. points (steps and ramps - to provide habitat for intertidal biota and splash zone coastal species. The textures are described and shown in the LUDP, the Seawall Revetment Habitat Plan (SRHP).
- Ecological enhancements, such as tide pools, vertipools, and small drilled rock pools are applied to discrete locations along the coastal edge that are within the intertidal zone.
- Re-use of colonised rocky material in front of the new curved seawalls to suit condition EM.19 (c) of the SRHP.
- Providing for fish passage at stream culverts to ensure the current level of passage for fish species migrating into upstream freshwater habitats is maintained or improved.

The number and locations of ecological enhancements may change post-construction based on suitable areas for placement to achieve the best ecological outcomes. The main ecological limitation for placement of ecological enhancements is that they need to be within the intertidal zone.

Figure 1.13 Texture applied to the curved seawalls

Figure 1.14 Texture applied to the curved seawalls

Priorities for Ngau Matau & Sorrento Bay

Planting

LV 7. (f)(g) -Trees, planting, natural character

Planting

The planting design for Ngau Matau & Sorrento Bay gives consideration to the dynamic coastal environment, its ecology, the various user experiences along the route, and maintenance and operations factors. Plant species have been chosen from the Plant Palette in the LUDP, which has been developed with the Project Ecologists. This includes indigenous species, which are suited to this specific coastal environment, and will encourage species of birds, lizards and insects which currently (or could potentially) inhabit areas along the route.

Proposed planting is reflective of (and reinforces) the Ngau Matau & Sorrento Bay context; planting provides a variety of experiences, in response to the character, context, landscape and natural features along the route.

Natural Character

The overall adverse effects on natural character for Ngau Matau & Sorrento Bay are considered to be less than minor for the coastal landscape. The landscape and urban design approach and principles have been developed to mitigate effects of the project on natural character.

As outlined in the LUDP, it is expected that the effects on natural character from the Project, including the seawall and Shared Path, will lessen over time as they weather and become established. A list of mitigation measures related to natural character attributes is provided below. Further detail of mitigation of effects on natural character and integration with the natural landscape is provided with the description of design areas and elements in the Urban Design Outcomes Section of the LUDP.

Legibility – geomorphology:

- Retention of local rock for reuse at base of the seawalls.

Legibility - wayfinding and orientation:

- Reinforcement of the undulating coastline morphology by positioning the Shared Path along the coastal edge.

- Opportunities for local variation/reinforcement of local identity in the form of access points from the path to the foreshore.
- Improved access to headlands with strong natural character and natural features (such as trees, rocky outcrops and rock stacks).
- Provision of wayfinding markers, street furniture and signage to reinforce the bays and associated neighbourhoods.
- Provisions for cultural expression and naming to reinforce sense of place.

Visibility - public and private views:

- Consistent detailing along the coastal and road edges to reduce the visual impact.
- Appropriate/considered design of urban and landscape elements such as seating, bins, handrails, seaward side linear barriers, stormwater outlets, planting, signage and path markings to integrate them with the landscape.

Waiuatua Euphorbia glauca, shore spurge

- Incorporation of eco-mitigation surface textures consistently applied along the lower curve and 'step' of the wall to reduce the visual presence of the seawalls.
- Any safety balustrades to be designed as 'transparent' as possible to reduce visual appearance.

Picturesqueness:

- Path alignment responds to the local landform and land use patterns.
- Sensitive detailing of urban design and landscape elements, that respond to Mana Whenua (Taranaki Whānui and Ngāti Toa Rangatira), community identity and sense of place.
- Removal of existing unsightly structures and infrastructure along the project site and the replacement of an eroding road with a consistent structurally stable edge.

Wī Poa cita. silver tussock

Wīwī Ficinia nodosa, knobby clubrush

Sand piripiri Acaena pallida, sand bidibid

Bird Protection Plan

LV 7. (o) - Other Matters

The Bird Protection Plan (BPP) outlines a range of measures that Hutt City Council (the Consent Holder) will implement over the lifetime of the Tupua Horo Nuku project to avoid or minimise adverse impacts on avifauna within the project area, with a particular emphasis on little penguins and shoreline foragers such as variable oystercatchers. The measures contained within the BPP are designed to meet Consent Conditions EM.3 through to EM.9. For Ngau Matau & Sorrento Bay the Bird Protection Area will be established in accordance with the BPP required by the consent conditions.

Screening and barriers

The following features are proposed to be incorporated in Sorrento Bay:

- A 1.2-1.8m screening fence along Marine Drive, to prevent dogs wandering into the Torea Pango / Variable Oystercatcher nesting habitat.
- Associated warning signage on the Shared Path within Sorrento Bay, to reduce the risk of dogs and people venturing into the nesting habitat while allowing Torea Pango / Variable Oystercatcher unimpeded access.
- Interpretation panels informing the public of the presence of nesting Torea Pango / Variable Oystercatcher and providing information on key elements of the birds' biology, life cycle and threats.
- Little penguin barriers to planted area in Ngau Matau.

Screening fence along Marine Drive shall be approximately 85m long and vary between 1.2-1.8m in height. It will be constructed from timber in keeping with the urban design theme where variable thickness palings are used to add variety and interest to the fence when viewed from the road and footpath.

Interpretation panels shall be installed at either end of the screening fence, providing information on the lifecycle and habitat requirements of Torea Pango / Variable Oystercatchers, the threats that they face and information on how Shared Path users can minimise their impact on the oystercatchers nesting in Ngau Matau & Sorrento Bay.

Smaller warning signs shall be affixed to the Shared Pathway side of the screening fence at approximately 50m intervals along the entire length of the fence. These warning signs shall notify Shared Path users that the rocky foreshore beyond the fence provides nesting habitat for Torea Pango / Variable Oystercatchers, and request that Shared Path users do not venture onto the rocky foreshore between the months of August and February inclusive. The specific content of these signs will be developed in consultation with the Kororā / Little Penguin Interest Group and Mana Whenua and will include design elements contributed by local students participating in the public education campaign for avifauna described in the BPP.

Little penguin barriers are proposed in planted areas through Ngau Matau to help prevent little penguins from crossing the Shared Path and Marine Drive.

Pest control

The following features are proposed to be incorporated in Ngau Matau & Sorrento Bay:

- Predator traps designed to target key predators of Variable Oystercatchers, namely mustelids, hedgehogs and rats.

DOC200 kill traps will be spaced at 50m intervals along the seaward side of the fence between the Shared Path and Sorrento Bay, and at 50m intervals around the perimeter of the Torea Pango / Variable Oystercatcher nesting habitat, as part of the Eastern Bays Shared Path Predator Management Strategy. These DOC200 traps will be installed, checked and maintained by Mainland Island Restoration Operation (MIRO) volunteers, as part of MIRO's wider Educating Residents about Trapping (ERAT) predator trapping programme. A more detailed description of the Eastern Bays Predator Management Strategy can be found in Section 7 of the BPP.

Planting Plan

Torea Pango / Variable Oystercatcher require unvegetated rock, sand or shingle substrates for nesting and tend to avoid heavily vegetated habitats. For this reason, there are no plans to create additional plantings on the existing rocky foreshore.

Priorities for Ngau Matau & Sorrento Bay

Urban Design

LV 7. (h)(i)(j)(k) - Open spaces, features and signage

The Design Features Report (DFR) (Stantec, 2019) established a set of design principles and outlined the engineering requirements for the project. This BSUDP has been developed in general accordance with these principles and requirements. The LUDP outlines the overarching principles, palettes, and narratives for detailed design. Principles for Ngau Matau & Sorrento Bay can be summarized as:

- Reflective of rugged coastal environment materiality, robustness.
- Less is more emphasise the natural setting and views.
- Maintain integrity of natural rock outcrops.
- Retain and enhance coastal vegetation where possible along coastal edge.
- Consistency across elements a coordinated suite.
- Simple robust forms.
- Simple colour, surface texture, bespoke signage palettes.
- Maintenance considerations.
- Bay specific narratives expressed through cultural design.
- Sympathetic materials palette.

Open space and Recreational Amenity

Tupua Horo Nuku provides a connection to a continuous coastal edge experience along Ngau Matau & Sorrento Bay. The Project will enhance existing levels of recreation and amenity values with the Shared Path improving access for people walking and cycling along the coast and between bays. This enhanced access includes new beach access points providing access to the foreshore. The main priorities identified are:

- Creating a fit for purpose Shared Path that provides access to the coast and to the bays between Point Howard and Eastbourne for people walking, cycling, and using other small wheels.
- Provide access to the beach, water and headlands.
- Provide stopping and resting places.
- Maintain views to the coast.
- Retain fishing access.

Furniture and Features

The furniture palette for Ngau Matau & Sorrento Bay consists of interpretation signage and wayfinding, seating, bike racks and bins. The palette reflects the coastal setting of Tupua Horo Nuku and provides opportunities for cultural expression and narrative to some elements.

The design outcomes relating to furniture are:

- Use of standard Hutt City Council design elements where practical.
- A cohesive suite across multiple elements using robust materials suitable to the coastal environment.
- Appropriate in scale and number, avoiding visual clutter so as not to detract from their environment.
- Contribute positively to the character of Tupua Horo Nuku.
- Allow for opportunities to incorporate individual bay identities.

Formal seating is generally provided at places where stopping and gathering is encouraged and there is sufficient space. The proposed seats are made of timber which is a hard wearing material suitable for the coastal environment. There is a mixture of seating options including benches and seats with back rests and arms. The design is robust, with preference given to solid, chunky forms that are more in keeping with the coastal environment.

Bike racks are generally co-located with complimentary furniture and near bus stops and stopping location. They have been located appropriately to assist safe and easy movement along the path. A standard simple design with a narrow profile is proposed to reduce footprint.

Signage and Wayfinding

Where width allows, gathering spaces, beach access points and bus stops are appropriately separated from paths, to allow for slower and safer movement. Linemarking, symbols, and directional arrows are located at the approaches and alongside bus stops and beach access points to visually separate fast and slow movement to minimise conflict. These have been jointly expressed through cultural expression and symbols.

Traffic signage and markings will form part of the detailed design stage. The position of such signage should ensure minimal visual clutter and follow a clear design logic to the positioning, combination and layout of signs.

- Give consideration to Hutt City Council cycleways and NZ Transport Agency standards and Great Harbour Way precedents.
- Ensure CPTED concerns inform the wayfinding design approach.

- the path, according to need.
- coastal environment.

The design priorities relating to Signage & Wayfinding are:

- Create a visual language for Tupua Horo Nuku which suits the needs of the project and is in line with Hutt City Council standards.
- Clearly communicate and link key destinations and named landmarks, as well as assist in legibility of the proposed path.
- Ensure the level, format and intensity of wayfinding signage varies along
- Create a coherent graphic language using robust materials suited to the

Priorities for Ngau Matau & Sorrento Bay

Cultural Landscape

LV 7. (l)(m) - Storyboards and surface treatments

Celebration and interpretation of the cultural landscape is integral to the Project vision, design principles and design themes. The Cultural Narrative and Overlay for Tupua Horo Nuku sets out the principles and design response that will guide the cultural expression and create a foundation for the Project in partnership with Taranaki Whānui and Ngāti Toa and key project groups.

The Cultural Narrative and Overlay for the Project will be reflected in all parts of the urban and landscape design process from the overall form of the footprint, through a focus on kaitiakitanga and in the design of the seawall and other structures. This can also be realised though materials used, naming conventions, arrangement of gathering spaces, treatment of the stream crossings, signage, lighting, sculptural elements and artwork along with the consideration of options for future events, recreation and educational activities.

The following imagery illustrates specific Cultural Expression design elements by Len Hetet. These elements complement and form part of the integrated approach to cultural expression as in the vision for the Project and outcomes for all of the components; from the underlying form to specific details.

Patterns:

Te Āti Awa tupua rau, he auripo i te manga iti, he auripo i te manga nui raanei, he kaitiaki ki te whenua.

Te Āti Awa of many phenomenas, where there is a ripple in a small tributary or great river, there is a guardian and protector on the land.

 This speaks to the connection between the tidal movements and the creation of the eastern bays land mass by Tupua Horo Nuku – Ngake.

Mouri Marker:

 The Mouri Marker represents an area of significance to Mana Whenua. It will highlight the Māori and English names of the bays and allow for our cultural narratives of those bays to be told.

Other Matters

LV 7. (o) - Bus Stops & Shelters

As per the conditions bus shelters shall enhance safety and convenience, and minimise risk, for all users of the Shared Pathway and the road. Bus stops/ Shelters requiring replacement will, to the greatest extent practicable, be designed taking into account the following design principles:

- (a) A preference that the Shared Path run behind the bus stop/ shelter;
- The bus stop / shelter will be raised (separated with a kerb from the (b) traffic lane where possible);
- The bus stop / shelter will be designed in accordance with universal (c) accessibility principles (such as, but not limited to, wheelchair friendly ramps and tactile pavers); and
- Bus stop / shelter design will be fit for purpose to appropriately (d) protect public transport users from the coastal elements.

The Alliance is proposing to replace the existing bus stop shelter with a standard GWRC shelter. The benefits of replacing this shelter are:

- Create an accessible bus stop for those less mobile.
- Improve safety by having glass shelters that allow better visibility for path users.
- Provide a raised kerb/access point for bus shelters to ensure better safety for those boarding the bus.

A standard bus shelter is preferred by GWRC. These shelters were chosen as the design aligns well with the landscape and urban design principles with the potential for some modifications:

- Incorporate timber slats with a panel that can be painted and/or used as a community noticeboard.
- Painting of the roof fascia in a colour that matches the other urban design elements.
- Apply cultural expression onto glass or other materials.
- Potential to involve local schools in art creations.

Modification to entrance point to avoid prevailing wind and splashback from passing vehicles when wet.

We cannot use the existing bus shelter in Sorrento Bay when creating accessible bus stops due to the depth of the shelter. Using the existing shelter would encroach on the Shared Path and also on the coastal marine area.

The design outcomes relating to bus shelters are:

- Fit for purpose, providing best possible shelter from wind, rain and seawater ingress during storm events.
- Bus stop location needs to be safe & convenient for users.
- Bus shelters and entrance points onto the bus should be accessible for wheelchairs.
- Bus shelters should be designed so there is enough space for wheelchairs to get into them.
- Design to reflect a distinctly Tupua Horo Nuku aesthetic, fitting in with their surroundings while providing opportunity for unique, place based expression.
- Coastal plantings next to bus stops to soften hardscape through the bay specific plans.
